

# ACTUARIAL NOTE

Number 2008.2  
June 2008

Social Security Administration  
Office of the Chief Actuary

## Unisex Life Expectancies at Birth and Age 65

by Felicitie Bell, K. Mark Bye, and Al Winters

Life expectancies at birth and age 65 are shown in tables V.A.3 and V.A.4 of the 2008 Annual Report of the Board of Trustees. The life expectancies in those tables are presented on both a period and a cohort basis, separately, for males and females. This note provides the corresponding unisex life expectancies, and a brief explanation of their calculation method.

The following standard actuarial functions<sup>1</sup> are used in this note:

$\mathring{e}_x$  = the average number of years of life remaining at exact age x

$l_x$  = the number of persons surviving to exact age x

$l_0$  = the starting number of persons in life table at age 0 (radix)

Additionally, a second subscript is used to denote gender where the letters *u*, *m*, and *f* represent unisex, male, and female, respectively.

The Office of the Chief Actuary computes all unisex life table values from the corresponding male and female life tables based on the assumption of an annual sex ratio<sup>2</sup> of 1,050 male births occurring for every 1,000 female births. Thus, a unisex life table is created by combining a male life table with radix<sup>3</sup> 105,000 and a female life table with radix 100,000, and then rescaling the combined table to radix 100,000. At a given age x, the unisex life expectancy may be calculated as:

$$\mathring{e}_{x,u} = \frac{l_{x,m} \mathring{e}_{x,m} + l_{x,f} \mathring{e}_{x,f}}{l_{x,m} + l_{x,f}} \quad (1)$$

For unisex life expectancy at birth, notice that Equation (1) can be reduced for the case where  $x = 0$ ,  $l_{0,m} = 105,000$  and  $l_{0,f} = 100,000$ . In this case, unisex life expectancy at birth

<sup>1</sup> These actuarial functions are described in chapter IV of Actuarial Study Number 120, Life Tables for the United States Social Security Area 1900-2100. This study can be found at the following web address : <http://www.socialsecurity.gov/OACT/NOTES/as120/TOC.html>

<sup>2</sup> Since 1945, the sex ratio has varied from 1,046 to 1,059 male births to female births. For more information on the sex ratio see page 9 of the National Vital Statistics Report, Volume 56, Number 6.

<sup>3</sup> The radix of a life table is defined as  $l_0$ , and is selected to be an arbitrary but generally large integer.

is equal to the sum of 1.05 times male life expectancy at birth plus female life expectancy at birth divided by 2.05. Thus, we have the equation below:

$$\dot{\bar{e}}_{0,u} = \frac{1.05 \dot{\bar{e}}_{0,m} + 1.00 \dot{\bar{e}}_{0,f}}{2.05} \quad (2)$$

For age 65, the unisex life expectancy is computed as:

$$\dot{\bar{e}}_{65,u} = \frac{l_{65,m} \dot{\bar{e}}_{65,m} + l_{65,f} \dot{\bar{e}}_{65,f}}{l_{65,m} + l_{65,f}} \quad (3)$$

The tables on the following pages correspond to tables V.A.3 and V.A.4 of the 2008 Trustees Report. Table 1 presents historical and projected unisex life expectancies on a period basis (for the intermediate alternative, only) in the same format as table V.A.3 of the Trustees Report. Similarly, table 2 shows the unisex life expectancies on a cohort basis in the same format as table V.A.4 of the Trustees Report. For the purpose of comparison and easy accessibility, gender specific life expectancies are included in Tables 1 and 2. Detailed versions of tables 1 and 2, which contain unisex life expectancies for all years from 1940-2100, are also attached.

<sup>1</sup> The period life expectancy at a given age for a given year represents the average number of years of life remaining if a group of persons at that age were to experience the mortality rates for the year over the course of their remaining lives.

<sup>2</sup> Estimated.

<sup>3</sup> The projected values are based on the intermediate assumptions of the 2008 Trustees Report.

2085....	88.3	22.8	86.9	21.7	89.7	23.8

<sup>1</sup> The cohort life expectancy at a given age for a given year represents the average number of years of life remaining if a group of persons at that age were to experience the mortality rates for the series of years in which they reach each succeeding age. All mortality rates are consistent with those used for the intermediate assumptions of the 2008 Trustees Report.

<sup>2</sup> Cohort life expectancies at birth for those born on January 1 of the calendar year is based on a combination of actual and estimated death rates for birth years 1940 to 2004. For birth years after 2004, these values are based solely on estimated death rates.

<sup>3</sup> Age 65 cohort life expectancy for those attaining age 65 on January 1 of the calendar years before 1975 is based on actual data. For 1975 through 2004, these values are based on a combination of actual and estimated death rates. After 2004, these values are based solely on estimated death rates.

**Detailed Table 1 - Period Life Expectancies**

Calendar Year	Unisex		Male		Female	
	At birth	At age 65	At birth	At age 65	At birth	At age 65
1940	63.5	12.7	61.4	11.9	65.7	13.4
